

Browse Control

Control Surfing by Enabling and Disabling Internet Usage

"82% of UK employees admit to personal surfing at work for more than three hours per week"

"72% of UK firms have dealt with internet misuse in the workplace"

"Disciplinary cases for e-mail and internet abuse at work in the last 12 months exceeded those for dishonesty, violence and health and safety breaches put together"

Control Internet Activity

Browse Control delivers control of internet surfing and enforces Internet usage policies in your organisation. BrowseControl can completely block the Internet, allow access only to Web sites you specify, denying access to any domain, schedule Internet ON at certain times of day and much more. E-mail, FTP sites, Instant Messaging, ICQ, Newsgroups etc. can be restricted.

Application Blocker

In addition to restricting Internet activity, BrowseControl includes an Application Blocker, allowing you to specify software applications you want to block the user from running. This can be useful in preventing users from using games, messaging programs, P2P applications or any unauthorized software.

Scheduler

Schedules can be created to allow Internet access at specific times only and in this way social networking sites or personal email may only be accessed during lunch hours.

Feature Summary

- Allow on the fly enable/disable of Internet.
- Schedule times during the day when Internet is enabled.
- Control and schedule per individual PC or Group, Department, Classroom.
- Control Internet access at workstation and classroom level.
